Canadian Data Report of Fisheries and Aquatic Sciences

Data reports provide a medium for filing and archiving data compilations where little or no analysis is included. Such compilations commonly will have been prepared in support of other journal publications or reports. The subject matter of data reports reflects the broad interests and policies of the Department of Fisheries and Oceans, namely, fisheries and aquatic sciences.

Data reports are not intended for general distribution and the contents must not be referred to in other publications without prior written authorization from the issuing establishment. The correct citation appears above the abstract of each report. Data reports are abstracted in *Aquatic Sciences and Fisheries Abstracts* and indexed in the Department's annual index to scientific and technical publications.

Numbers 1–25 in this series were issued as Fisheries and Marine Service Data Records. Numbers 26–160 were issued as Department of Fisheries and the Environment, Fisheries and Marine Service Data Reports. The current series name was introduced with the publication of report number 161.

Data reports are produced regionally but are numbered nationally. Requests for individual reports will be filled by the issuing establishment listed on the front cover and title page. Out-of-stock reports will be supplied for a fee by commercial agents.

Rapport statistique canadien des sciences halieutiques et aquatiques

Les rapports statistiques servent à classer et à archiver les compilations de données pour lesquelles il y a peu ou point d'analyse. Ces compilations auront d'ordinaire été préparées à l'appui d'autres publications ou rapports. Les sujets des rapports statistiques reflètent la vaste gamme des intérêts et des politiques du ministère des Pêches et des Océans, c'est-à-dire les sciences halieutiques et aquatiques.

Les rapports statistiques ne sont pas destinés à une vaste distribution et leur contenu ne doit pas être mentionné dans une publication sans autorisation écrite préalable de l'établissement auteur. Le titre exact paraît au-dessus du résumé de chaque rapport. Les rapports statistiques sont résumés dans la revue *Résumés des sciences aquatiques et halieutiques*, et ils sont classés dans l'index annuel des publications scientifiques et techniques du Ministère.

Les numéros 1 à 25 de cette série ont été publiés à titre de relevés statistiques, Services des pêches et de la mer. Les numéros 26 à 160 ont été publiés à titre de rapports statistiques du Service des pêches et de la mer, ministère des Pêches et de l'Environnement. Le nom actuel de la série a été établi lors de la parution du numéro 161.

Les rapports statistiques sont produits à l'échelon régional, mais numérotés à l'échelon national. Les demandes de rapports seront satisfaites par l'établissement auteur dont le nom figure sur la couverture et la page du titre. Les rapports épuisés seront fournis contre rétribution par des agents commerciaux.

ABSTRACT

Schubert, N.D., P.G. Paterson and C.M. McNair. 1988. The Fraser River chinook salmon test fishery: data summary, 1980-87. Can. Data Rep. Fish. Aquat. Sci. 709: 193 p.

A gill net test fishery for chinook salmon (**Oncorhynchus tshawytscha**) was conducted in the lower Fraser River between 1980 and 1987. Test fishery procedures, fishing location, gear and time were standardized to provide a relative index of in-river chinook abundance and run timing.

Daily fishing effort, catch by species and catch per unit effort by species are reported by set for the years 1980 to 1987. Also reported for chinook salmon are age of the daily catch, by sex and flesh colour, mean daily length and weight, the incidence of hook and predator marks, and the incidence of adipose clips and coded wire tags.

Key words: test fishery, Fraser River, chinook salmon, fishing effort, catch, effort, catch per unit effort, biological sample.

RÉSUMÉ

Schubert, N.D., P.G. Paterson and C.M. McNair. 1988. The Fraser River chinook salmon test fishery: data summary, 1980-87. Can. Data Rep. Fish. Aquat. Sci. 709: 193 p.

De 1980 à 1987, on a procédé à des pêches d'essai au filet maillant pour le saumon quinnat (**Oncorhynchus tshawytscha**) dans le cours inférieur du fleuve Fraser. Les pêches d'essai ont été normalisées à l'égard de la méthode de capture, de la position, du type d'engin de pêche et du temps de l'anneé; ceci résultant en l'élaboration d'un index relatif de l'abondance et de la période de remonte du saumon quinnat en eau douce.

On fait l'état, pour chaque mouillage, de l'effort de pêche quotidien, de la capture par espèce et de la capture par unité d'effort par espèce, ceci pour la période s'étalant de 1980 à 1987. Sont aussi rapportés, pour le saumon quinnat, l'âge des captures quotidiennes, par sexe et couieur de la chair, les longueurs et poids moyens quotidiens, ainsi que l'incidence d'hamecons, de traces de prédation, d'agrafes adipeuses et d'étiquettes métalliques codées.

Mots-clés: pêche d'essai, fleuve Fraser, saumon quinnat, effort de pêche, capture par unité d'effort, échantillons biologiques.

INTRODUCTION

A gill net test fishery for chinook salmon (**Oncorhynchus tshawytscha**) has been conducted annually in the lower Fraser River near Albion since June, 1980 (Fig. 1). The test fishery, which was established to assess inseason chinook abundance and run timing, was implemented when the directed harvest of chinook salmon by the Fraser River commercial gill net and sport fisheries was eliminated in response to declining returns to the river.

The test fishery was located at the upper end of McMillan Island, approximately 50 km upstream from the Fraser River mouth, at a site known as the "Graveyard Drift". Two standardized sets were conducted daily through most of the chinook migratory period. This report describes the daily test fishing procedures and documents daily fishing effort, catch, catch per unit effort and biological sample results.

METHODS

GEAR

The test fishery was conducted under contract by the "Spring Fever", a 10.7 m gill net vessel. The net was constructed from multifilament nylon twine (size code 48), had a 216 mm (8 in) mesh, as measured between opposite knots of a single stretched mesh, and was light green in colour (R4, Redden Net Company colour code). The net was 274 m (150 fathoms) in length and was hung in a 3:1 ratio, where one meter of cork line supported three meters of net. The standard net depth was 50 meshes; however, a 60 mesh net was used when river depth at Albion exceeded 3.1 m (generally mid May through mid June). Lead line weight varied with river discharge, ranging from 0.3 kg per meter of net at low discharges to 0.6 kg per meter of net during freshet.

TEST FISHING

Test fishing normally occurred between early April and mid October, with procedures standardized as much as possible both within and between years. The 1980-86 test fisheries were conducted three days per week (Monday, Wednesday and Friday), with the schedule adjusted to ensure that test fishing would not occur during commercial gill net fisheries in the lower Fraser River. In 1987, test fishing occurred seven days per week, except during commercial fisheries.

The test fishery net was set perpendicular to the river shore and allowed to drift with the current. The net was set twice per day for approximately 30 minutes each set, although set time varied in response to current speed or size of the catch. Fishing was scheduled so that the second set ended immediately prior to the highest of the two daily high tides. This permitted the spring and summer sets to occur during daylight hours, which was necessary to avoid heavy debris during peak annual river discharges. Because in-river tidal patterns were influenced by wind and river discharge, daily fishing time was often more variable than indicated by tidal charts.

Information recorded for each set included the start and end time for setting the net (i.e. the time when part of the net first entered the water to the time of complete immersion), the start and end time for retrieving the net, and catch by species.

CATCH PER UNIT EFFORT CALCULATION

Daily catch per unit effort (CPUE) was calculated by species to provide a relative index of abundance. CPUE was the ratio for both sets of the total catch (pieces) and the total fishing effort (fathom-minutes), where effort was the product

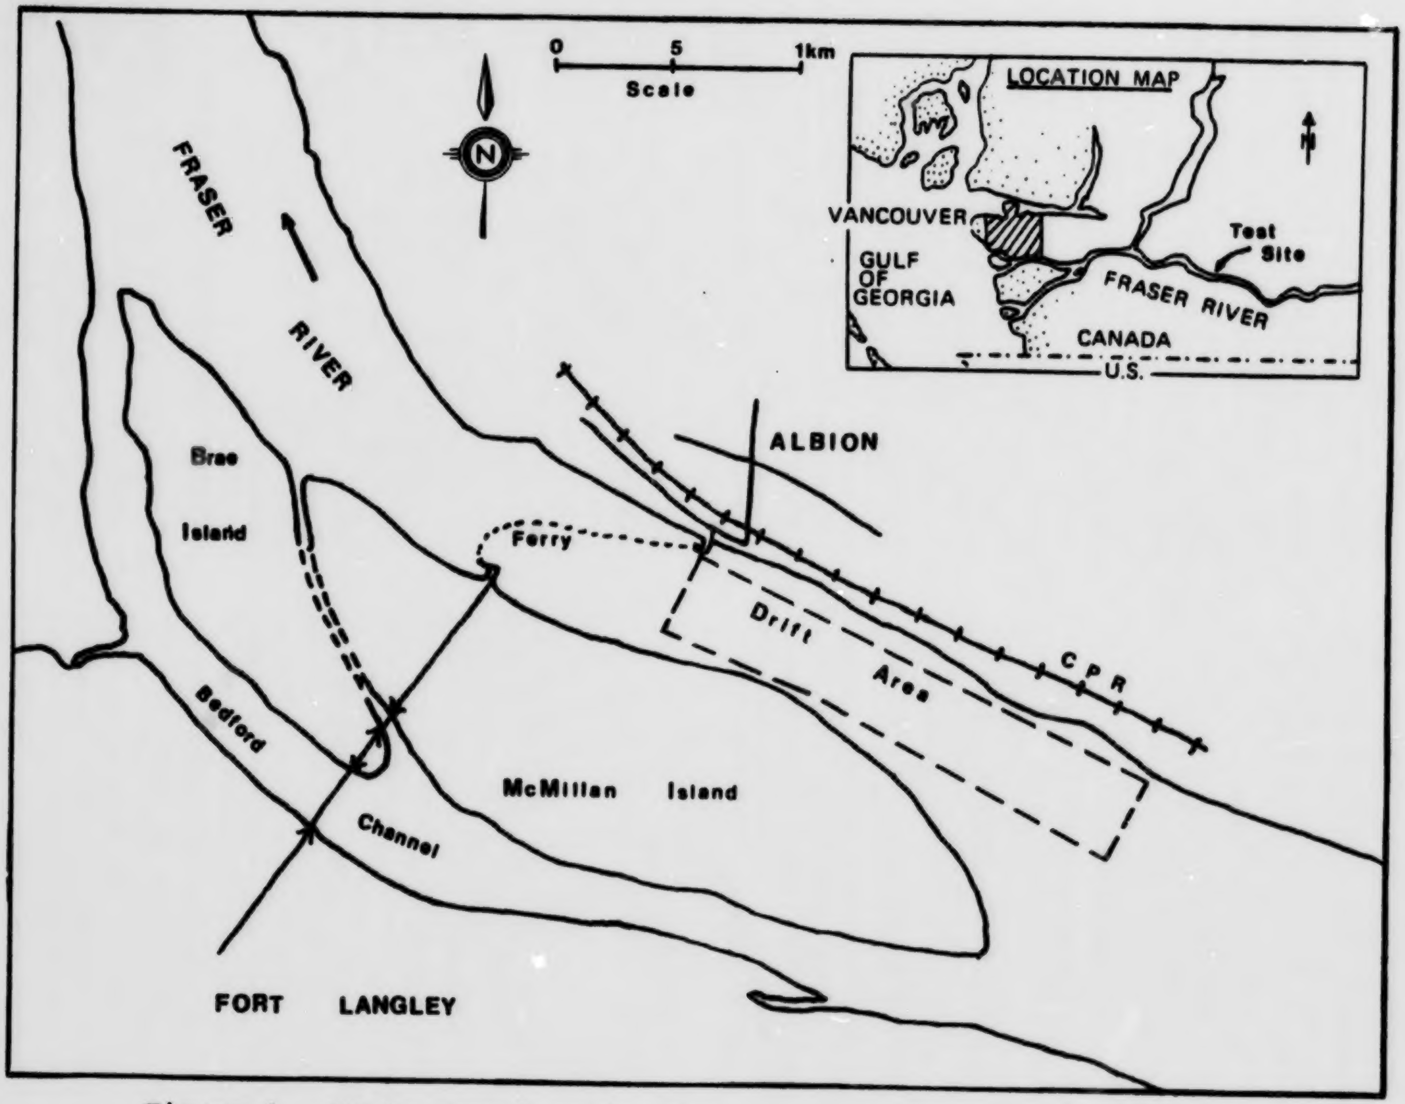

Figure 1. Study area location map.

of the time the net was in the water (minutes) and the length of the net (fathoms). The ratio was then multiplied by one thousand to permit the expression of index values to two decimal places.

Because the net did not fish at full efficiency during the setting and retrieval periods, setting and retrieval times were divided by two. Fishing time, therefore, represents the total time the center of the net was immersed.

The mathematic relationships are reported below. Similar procedures were used to calculate individual indices for the first and second sets.

1) Total daily fishing time (T) in minutes:

$$T = \sum_{n=1}^{2} d_n + \frac{s_n + r_n}{2}$$

2) Total daily fishing effort (E) in fathom-minutes:

$$E = T \cdot L$$

3) Total daily catch (C_i) by species, in pieces:

$$C_i = \sum_{n=1}^{2} c_{in}$$

4) Total daily index (I_i) by species, in catch per fathom-minute:

$$I_i = \frac{C_i}{E} \times 10^3$$

where s_n = time spent setting the net during set n,
r_n = time spent retrieving the net during set n,
d_n = time entire net was immersed during set n,
L = length of net in fathoms (150),
c_{in} = catch of species i during set n.

SAMPLING

The daily catch of chinook salmon was sampled as follows: length (post-orbital-hypural plate length to nearest 0.1 cm), whole weight (kg), sex, flesh colour (red or white) and adipose fin condition were recorded and scale samples (five scales from each preferred region) were obtained from each chinook. For individuals without an adipose fin, the head was removed posterior to the eye orbit for later coded wire tag (CWT) recovery and decoding. Beginning in 1982, the incidence of hook marked and predator marked chinook was also recorded.

Sample data are reported for 1981-87; 1980 data were lost. For 1981-86, up to 20 chinook per day were sampled, as above. In 1987, all chinook were sampled.

DATA ORGANIZATION

Daily setting and retrieval times and catch by species in the first and second sets are summarized by year in Appendices 1 to 8. Daily fishing time (T), effort (E) and catch per unit effort (I) in both sets, first set and second set are summarized by year in Appendices 9, 10 and 11, respectively. The daily age composition, mean length and mean weight of the total daily chinook catch and the catch of chinook males and females, and of red and white fleshed chinook are summarized by year in Appendices 12 to 18. The incidence of hook and predator marks and adipose clips is summarized by year in Appendix 19; also included are CWT recoveries from adipose clipped chinook.

ACKNOWLEDGEMENTS

We gratefully acknowledge the contribution of Alan Baker and assistants, who operated the test fishery since it's inception in 1980. Thanks are also extended to G. Buxton and L. Kalnin for supplying logistical support. All scales were analysed under the supervision of Y. Yole. Coded wire tags were recovered and decoded by Department of Fisheries and Oceans Head Recovery Program personnel. R. Reimer prepared the text for publication.
